

PHASE 1 — Project Foundation

A. Define the Project

Name:

Localization Audio Pipeline Demo

Scope:

- 2 languages (EN + ES is enough)
- 1 game genre (e.g. shooter, RPG, sports)
- 2–3 characters

B. Voice Creation

- Use **free libraries or sources** (important to verify licensing)

Start with: **50–80 lines**

PHASE 2 — Audio Processing (RX)

Audio Cleaning:

- De-noise
- De-click
- Basic EQ
- Loudness normalization

Goal: “Clean and consistent audio across all files”

PHASE 3 — Organization

A. Naming Convention

Define a **clear and consistent naming convention based on game industry standards**

Example:

VO_EN_Player_Attack_001.wav

VO_ES_Player_Attack_001.wav

B. Excel

Create an audio tracking sheet using **Microsoft Excel**

Columns:

- ID
- Language
- Character
- Line Type
- File Name
- Status

PHASE 4 — Python

Use Python for basic file automation:

- Rename files
- Move files
- Read folders

Real example:

Script that converts: line1.wav → VO_EN_Player_Attack_001.wav

PHASE 5 — Wwise

- Import audio files
- Create Events
- Organize by language
- Generate SoundBanks

PHASE 6 — Unreal Engine

- Create a simple input (button or key)
- Trigger audio events

Optional: Language switch system

RESULT

This project demonstrates a complete **end-to-end localization audio pipeline**, replicating real-world workflows used in game production environments.

- Successfully processed and standardized **50–80 dialogue lines across multiple languages (EN/ES)**
- Applied consistent **audio cleanup and loudness normalization** using professional tools
- Designed and implemented a **clear naming convention** aligned with industry standards
- Built an **audio tracking system in Excel** to manage assets, languages, and production status
- Developed **Python scripts** to automate file renaming and organization, improving efficiency and scalability
- Integrated audio into **Wwise**, creating structured events and generating SoundBanks
- Implemented and tested audio playback inside **Unreal Engine**, including basic triggering and language switching

Outcome:

A fully structured, scalable, and production-ready audio pipeline, demonstrating strong skills in **audio processing, asset management, and game audio integration**.
